WHAT IS CLAIMED IS

5

1. An image processing apparatus, comprising:

a memory which stores a code stream having a wavelet division level;

- an interface unit which transmits the code stream to another apparatus; and
- a processing unit which changes the wavelet division level of the code stream before the transmission of the code stream to said another apparatus by acquiring a target division level that is a wavelet division level of said another apparatus, checking a difference between the target division level and the wavelet division level of the code stream, generating data that compensates for the difference, and embedding the generated data into the code stream.

claimed in claim 1, wherein in response to the difference indicating the target division level lower than the wavelet division level of the code stream, said processing unit generates the data that compensates for the difference by reading coded data belonging to levels higher than the target division level, decoding the read coded data to obtain wavelet coefficients, performing inverse wavelet transform on the wavelet coefficients to generate LL component data, and encoding the LL component data.

image processing apparatus 3. The in claim 1, wherein in response to the claimed difference indicating the target division level higher than the wavelet division level of the code stream, said processing unit generates the data that compensates for the difference by reading coded data of an LL component belonging to a level lower than the target division level, decoding the read coded wavelet component to obtain LLdata of the coefficients, performing wavelet transform on the wavelet coefficients to generate wavelet coefficients of the target division level, and encoding the wavelet coefficients of the target division level.

5

4. The image processing apparatus as claimed in claim 1, wherein said processing unit changes a description of coding conditions stored in the code stream, the change in the description being responsive to the change in the wavelet division level of the code stream.

15

5. The image processing apparatus as claimed in claim 4, wherein said description of coding conditions is a description of a decomposition level number included in parameter SPcod regarding a coding style of components, which is part of a default coding style marker (COD) contained in the code stream.

- 6. A computer-readable record medium having a program embodied therein for causing a computer to transmit a code stream having a wavelet division level to another apparatus, said program comprising the steps of:
- a wavelet division level of said another apparatus;

checking a difference between the target division level and the wavelet division level of the code stream;

generating data that compensates for the difference; and

embedding the generated data into the code stream so as to change the wavelet division level of the code stream before the transmission of the code stream to said another apparatus.

20

claimed in claim 6, wherein in response to the difference indicating the target division level lower than the wavelet division level of the code stream, said step of generating the data that compensates for the difference carries out:

reading coded data belonging to levels higher than the target division level;

decoding the read coded data to obtain wavelet coefficients;

performing inverse wavelet transform on the wavelet coefficients to generate LL component data; and

encoding the LL component data to generate the data that compensates for the difference.

15

- 8. The computer-readable record medium as claimed in claim 6, wherein in response to the difference indicating the target division level higher than the wavelet division level of the code stream, said step of generating the data that compensates for the difference carries out:
- reading coded data of an LL component

belonging to a level lower than the target division level;

decoding the read coded data of the LL component to obtain wavelet coefficients;

performing wavelet transform on the wavelet coefficients to generate wavelet coefficients of the target division level; and

encoding the wavelet coefficients of the target division level to generate the data that compensates for the difference.

9. The computer-readable record medium as claimed in claim 6, wherein said program further includes a step of changing a description of coding conditions stored in the code stream, the change in the description being responsive to the change in the wavelet division level of the code stream.

claimed in claim 9, wherein said description of coding conditions is a description of a decomposition level number included in parameter SPcod regarding a coding style of components, which is part of a default coding style marker (COD) contained in the code stream.
